

ChainLinx[®]

Property & Evidence Management System

CHAINLINX ISN'T JUST ABOUT BARCODES...

...IT'S ABOUT YOUR
**ENTIRE
EVIDENCE
MANAGEMENT
SYSTEM**

Secure & automate evidence management for your property room & the agencies you interact with by leveraging the strength of ChainLinx, the most complete property & evidence management solution on the market.

ChainLinx maintains a detailed “z-order” chain-of-custody. Unlike other property & evidence management applications, ChainLinx goes beyond the simple logging of transfer histories. Using a bar code and PIN protected process, ChainLinx records the current and target location for each complete, two-sided transfer. This transfer method maintains a true chain-of-custody and prevents inadvertent changes of a single transfer history that could invalidate the continuity of your evidence.

The ChainLinx evidence reconciliation feature provides the ability to quickly and efficiently inventory your entire property and evidence warehouse! And ChainLinx Alerts even remind users of scheduled reconciliations. This amazingly streamlined process manages the scheduling and completion of the reconciliation process for the entire property room, not just as one large room, but as individual storage locations within it. In fact, each of these locations can be scheduled for reconciliation separately. Users simply scan the bar code of the storage location and every item in it. ChainLinx does the rest! Complete reports are generated that show verified items, missing items and even items that are misfiled. Complete chain of custody updates are generated for the reconciliation process and for each item of evidence in the reconciled storage location.

With ChainLinx new Smart Client, evidence is logged and remotely submitted to the property room before it leaves the scene! Responders begin logging in their evidence data in the field using laptop computers. With wireless capabilities, this information is immediately sent to the ChainLinx server. Without, it is retained on the laptop and submitted when a connection is available, or stored and submitted manually, using external media such as a USB drive. Property & Evidence officers need only verify the information and receive the evidence!

Say goodbye to the days of people standing at the property room door waiting for evidence! With ChainLinx new Request for Transfer feature, individuals both in and out of the property room can request evidence before they need it, thus eliminating the rush for processing. This can be done directly within the ChainLinx application, from a Crime Lab with JusticeTrax LIMS-Plus IMUA, and even by other users and applications through ChainLinx web services.

Request for Transfer

Notifications & Alerts

ChainLinx internal messaging system provides automated notifications of important tasks and items that require attention. Pending tasks from within an item management plan, such as a notification stating that an evidence item is ready for disposition will appear as a to-do. In addition, reminders for items outside the normal scope of managing the evidence can be set, such as a notice of a court hearing entered from a subpoena. These alerts and to-do's can be scheduled on an individual or group basis, and single users or an entire unit can be notified of pending tasks directly from their ChainLinx home screen.

Customizable Item Management Plans

Another feature unique to ChainLinx! Item Management Plans allow the department to customize the flow of individual types of evidence, from intake to final disposition and automate many of the tedious day-to-day activities surrounding this process. A successful Item Management Plan ensures the movement of evidence items in and out of inventory as quickly and efficiently as possible. Automate your property and evidence room SOP's by eliminating the manual tasks of sending notifications to agencies and property owners and requesting approvals from administration, and by scheduling automated alerts to notify property and evidence staff of impending activity.

Web Delivery

ChainLinx is presented using a standard Internet browser. While the database and agency data reside on a server within the Department, users simply open a standard browser, and access the ChainLinx application from any pc or mobile computer with appropriate network rights. With web delivery, there is no desktop access to anything other than the

web server and no software installation required on client computers. In addition, maintenance and upgrades to client computers are completely eliminated, and future upgrades are a breeze. If you add more licenses, the users will be live on the system in only a few minutes.

Dynamic User Interface

ChainLinx Dynamic User Interface is the first of its kind. JusticeTrax understands that no two Property and Evidence rooms are the same, and that different information must be managed to effectively streamline the evidence management process. The Dynamic UI allows the department to customize the ChainLinx screens for this purpose, as opposed to requiring expensive, time consuming requests for customization by the vendor. The Dynamic UI walks the administrator through the process of creating custom fields throughout the application, and defining when and where these fields appear. Present these fields to your users only where the information is appropriate, and collect specific information for different evidence types, crime types and individuals. ChainLinx eliminates the pain of being limited to the information found on generic data entry screens.

Web Services

The web services in ChainLinx allow different software systems to communicate over a network or the Internet. These services allow for easy integration between ChainLinx and other applications in use within the department. If you have a records management system (RMS) that you need to link to ChainLinx, our web services allow us to get the job done quickly using industry standard practices. They also ensure that all JusticeTrax products can "talk to each other". Leverage ChainLinx web services to simplify the movement of information in & out of the system for both your evidence room & the agencies with whom you interact. Eliminate data entry into multiple applications, and generate & receive requests for evidence transfers electronically.

Never lose track of your evidence again

Spend your time **moving evidence**, not paper

Never miss a **deadline** with ChainLinx alerts

Keep your shelves clear by **disposing of evidence faster**

Install **ChainLinx once**, use it everywhere

Make ChainLinx your own with **custom screens & workflows**

Share **real-time information** with JusticeTrax LIMS-plus® & other applications

ChainLinx dashboard gives users a head start on their daily workload!
